

INTELLIGENT INFORMATION DELIVERY SYSTEM

ABSTRACT

A system and method for delivering relevant information to 5 recipients in a timely manner. Information from a plurality of sources is received through interface devices that permit a central processor to evaluate each information stream in light of the dynamic profiles that are stored in a subscriber database. A plurality of location sensors track and report the location of the various recipients. The processor determines the content that will be provided to the recipient and the delivery mode to be used for delivering the selected information to the subscriber.
